Summary

Full-stack software engineer with three years of production experience on Lentho.com, a multi-tenant platform used by 5,000+ people daily, working remotely in a distributed Agile team. Frontend in Next.js, React, TypeScript and Flutter; backend projects in FastAPI, Express and PostgreSQL covering REST API and schema design, JWT authentication, real-time features and Docker. Research background in federated learning.

Technical Skills

Languages: TypeScript, JavaScript, Python, HTML5, CSS3, C++
Frontend: React, Next.js, Flutter, Tailwind CSS, Zustand, TanStack Query
Backend & Databases: FastAPI, Node.js, Express, PostgreSQL, MySQL, Prisma, REST APIs, WebSockets, JWT, MinIO (S3)
Tools: Git, Docker, CI/CD, Unit Testing, Jira, Swagger, Sentry, WordPress
AI Coding Tools: Claude Code, OpenAI Codex, Gemini CLI

Professional Experience

Project Lead & Web Developer (Freelance) July 2026 – Present
Risk & Safety Solutions Melbourne, Australia *Remote*

- Leading the company's website rebuild end to end, from design to the WordPress implementation: designing the site, planning and splitting work across a two-developer team, and running client feedback rounds.
- Set up a workflow where the developers build the WordPress base and an AI coding agent implements the pages.
- Structuring the site so the client's non-technical staff can manage all content on their own after handover.

Software Engineer May 2023 – May 2026
The WOS Germany GmbH, Mönchengladbach, Germany *Remote*

- Shipped 15+ production features for Lentho.com, a multi-tenant food ordering, deals and cashback platform used by **5,000+ people daily**, across its storefront, restaurant panel, back office and Flutter app.
- Built and maintained German/English localization across all three web apps with next-intl, including translated Zod validation errors in checkout, login and registration.
- Improved performance by consolidating duplicate server-side fetches so restaurant pages and their SEO metadata share one API request, splitting heavy routes with dynamic imports, and compressing large images.
- Upgraded the back office from Next.js 14 to 16 and React 19; built its data-store pages with permission-based navigation and the date-range filters for finance and subscriber reports.
- Built the OTP verification form, a timed retry-payment flow for failed checkouts, and vendor and FAQ pages.
- Set up code review standards and QA checks for the distributed team, reducing production bugs by **30%**.

Projects

Collaborative Team Hub *Express, Next.js, PostgreSQL, Socket.io*

- Real-time, multi-tenant workspace for announcements, goals and action items: an 11-module Express REST API with Swagger docs, a Next.js frontend and a 14-model PostgreSQL schema (Prisma) in a Turborepo monorepo.
- JWT in httpOnly cookies with hashed refresh-token rotation, role-based access control and rate limiting; Zod validation shared by the API and the frontend.
- Socket.io live presence and notifications, optimistic UI with rollback, and a transactional audit log.
- Dockerized both apps and deployed them on Railway with health checks, structured logging (pino) and helmet.

Marketplace Workflow System *FastAPI, PostgreSQL, Next.js, Docker*

- Async FastAPI backend (SQLModel, asyncpg, Alembic migrations) and Next.js frontend for a project marketplace where buyers post work and solvers bid and deliver, with role-based access for each role.
- Accepting a bid runs in one transaction that rejects the competing bids, assigns the solver and moves the project to its next status; buyers see new bids through 5-second polling.
- Deliverables upload straight to MinIO through presigned URLs, so the API never proxies files; access tokens stay in memory with an httpOnly refresh cookie.

Education

B.Sc. in Computer Science & Engineering July 2023
Chittagong University of Engineering and Technology (CUET) CGPA: 3.21/4.00
Undergraduate thesis: Federated learning optimization using Laplacian Smoothing SGD combined with FedNova, evaluated on CIFAR-10.
